

Free · Open source · MIT licensed

Click. Captured. Done. So private it works with Wi-Fi off.

Full page screenshot in one click. No account, no watermark,
no cloud.

WIP Desktop & Web apps — stable versions coming soon

Works offline

Capture anything

Click the icon. Get the whole page. Or the visible area, or a region you drag — from the right-click menu or a shortcut.

Edit before you share

Arrows, boxes and text to make your point. Blur for the parts nobody else should see.

Record the tab

One click records, with auto zoom at every click. Trim on a timeline, then export WebM.

Private by default

No account, no upload, no telemetry. It works with your Wi-Fi off.

Nobody can see what you capture. Not even us.

Screenshots are often the most sensitive images on your machine. Capture, editing, export, PDF and recording all run in your browser. The extension makes no network request of its own, and it has no standing access to any site you visit.

Account	None
Upload	None
Telemetry	None
Watermark	None
Host permissions at install	None
License	MIT

- What it asks for at install
- What recording adds, only when you record

The same tables, with the full policy, on the [Privacy page](#).
[How it compares: OpenScreenShot vs GoFullPage vs FullPage Capture.](#)

Scriptable from your terminal. Still local.

openscreenshot on npm

- A separate, optional tool for scripts and AI agents
- Drives the Chrome already on your machine
- No browser download, no hosted service
- Also an MCP server, with a `capture_screenshot` tool

ONE SCREENSHOT

```
npx openscreenshot shot https://example.com --out shot.png --full
```

MCP CLIENT CONFIG

```
{ "command": "npx", "args": ["openscreenshot", "serve"] }
```

MADE FOR DEVOPS & CI/CD

DevOps

Snapshot dashboards, status pages and admin UIs straight into incident reports, runbooks and postmortems — from cron or a chat command.

CI/CD

Capture pages in your pipeline for docs, release notes and visual diffs on every deploy. One npx line, no hosted service.

FAQ

Questions, answered.

Is my data sent to a server?

Does it work on chrome:// and extension pages?

Why does full-page capture take a few seconds?

Can I skip the editor and copy or save a screenshot straight away?

Does PDF export bundle a heavy library?

Can I change the keyboard shortcuts?

Why does Chrome ask for tab capture access?

Where are my recordings stored?

Every question, plus the known limits, on the [Support page](#).

Ready in ten seconds.

1

Add it to Chrome

One click on the
Chrome Web Store.
Free, and no sign-up.

2

Click the icon

Or press the shortcut.
One click takes the
whole page; right-click
for the other modes.

3

Capture

Annotate, export, or
copy. It never leaves
your machine.

Add to Chrome

 OpenScreenShot

Screenshots that never leave
your machine.
